

Create a Django App

Activate the virtual environment

```
source .venv/bin/activate
```

Run the administrative utility in the project folder (where `manage.py` resides):

```
cd defaultDjango
python manage.py startapp myApp
```

The command creates a folder `myAPP` which contains the following main files:

1. `views.py`: contains the functions that define pages in the web app.
2. `models.py`: contains classes defining the data objects.

Creating a simple view

Modify `myApp/views.py` to creates a single view for the app's home page:

Map the URL
